

Jigs & Fixtures – Specialist Jig & Tool Supply

TQC have supplied a number of jigs and fixtures for the automotive, aerospace and welding industries. The abilities of our in-house jig and tool design facilities enable simple jigs and more complex fixtures to be designed to suit the customer's requirements.

The examples of jigs and fixtures shown here vary from a large fixture for measuring and checking a casting for the aerospace industry to a small cost effective jig to hold an automotive plastic bumper during the manual polishing process.

Jigs and fixtures along with specific tooling form a critical element of machinery designed and supplied by TQC, it is this experience which is used to supply standalone jigs and fixtures to our customers when required.

The following parts have been handled by a TQC jig or fixture.

- Automotive castings
- Automotive plastic bumpers & grills
- Aircraft castings
- Automotive welding fixtures
- Aircraft structures
- Automotive interior trim
